# Transmission

## Open House

- An approximately 7 kilometer long 115 kilovolt transmission line would be required to connect the generating station to an existing transmission line west of the Abitibi River.
- This would be a wooden pole line except for a couple steel structures which would be needed to span the River.
- The transmission line right-of-way would be approximately 40 meters wide.
- The transmission line generally occurs in an area that has been subject to forest harvesting over the last 15 years.
